

1. Orange sediment in red plastic bowl on the male's right bathroom counter (this had the highest readings I observed in the apartment)
2. Yellow powder in glass bread loaf pan on the male's right bathroom counter (this had a wooden pestle in it, indicating grinding and possible airborne concerns)

3. Yellow crystals in a green plastic bowl in the male's bathroom closet lower shelf

4. Yellow powder/residue in plastic cup in female's bathroom in the medicine cabinet above the toilet (would show material was not confined to his bathroom)

5. Black/grey powder on the outdoor patio near the doorway threshold (material exposed to the outdoor environment) by the way, you can see yellow splotches in this photo on the concrete

6. Small container of “green salt” in a cardboard box in the male’s bedroom near the radium revigator – it has a white top

7. Green liquid in glass flask on the left back of the male's bathroom counter

8. Yellow liquid in glass cylinder on the front left of the male's bathroom counter

9. Sample from contents of Taco Bell cup in male's bathroom closet to the right (this is how he said he leached his Fiestaware)

I was also interested in any readings, surveys, or spectra of:

10. Contents of safe on bathroom floor (Greg later told me that there were only papers inside of it, no rad material, so don't need anything further.)

11. Mo-99 – Tc-99m column on living room coffee table (I am trying to determine the “vintage” of this column. Is there any Mo-99 left? Not sure how we can estimate age but I was definitely still getting counts off of it.

12. 2 spinthariscopes on living room coffee table – Am-241? (white cylinders on L and R)
13. Small square with black electrical tape on living room coffee table – Am-241? (next to the petri dish)

14. White “pig/container” on living room coffee table (RAP did a spectra on this, 100-150 g U. The male wanted to open the container in front of me, but I didn’t let him, so I didn’t see the item. )

15. Cardboard box on male’s bathroom counter with black cube (RAP did a spectra on this, and said it was 400-800 g DU, so don’t need anything further.)
